# Inconsistency in behaviors of “sh10B” in Example 1-10

```
me00@me00:~/soft/exe04/cas1-10case
$ head -2 sh10B
#!/bin/sh
# File: sh10B
me00@me00:~/soft/exe04/cas1-10case
$ ./sh10B a.c a.o a.out
-e a.c: SRC file
-e a.o: OBJ file
-e a.out: other file
```

```
me00@me00:~/soft/exe04/cas1-10case
$ realpath `which sh`
/usr/bin/dash
me00@me00:~/soft/exe04/cas1-10case
$ realpath /bin/sh
/usr/bin/dash
```

- On Ubuntu, both `sh` and `/bin/sh` default to `dash` (a variant of B Shell), which does not support the `-e` option. (See sections of built-in `echo` in both `man bash` and `man dash` for more info. )
- Hence, the first command in Example 1-10 could be rewritten as `/usr/bin/bash sh10B a.c a.o a.out` with a view to producing the same output as that of the remote server.
